Non-blocking Input/Output API

- java.nio version 2 API
- Dokáže toho podstatne viac ako original java.io API
- Interakcia so súbormi a adresármi
- Zložité operácie so súbormi a adresármi
- Práca s atribútmi súborov
- Intuitívnejšie API s bohatšími funkciami na prácu so súbormi a adresármi

Rozhranie Path

- Inštancia Path predstavuje hierarchickú cestu v úložnom systéme k súboru alebo adresáru
- Path si môžete predstaviť ako náhradu NIO.2 za triedu java.io.File, aj keď spôsob, akým ju používame, je trochu odlišný
- Objekty java.io.File aj Path môžu odkazovať na absolútnu cestu alebo relatívnu cestu v rámci systému súborov.
- Oba môžu oba odkazovať na súbor alebo adresár
- Na rozdiel od triedy java.io.File, rozhranie Path obsahuje podporu pre symbolické odkazy

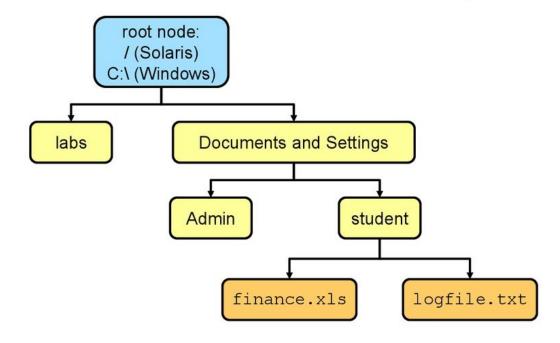

Prečo je Path rozhranie?

- Keďže Path je rozhranie, nemôžeme vytvoriť inštanciu priamo
- Rozhrania nemajú konštruktory
- Keď je vytvorená cesta, JVM vráti implementáciu špecifickú pre súborový systém, ako napríklad Windows alebo Unix Path triedu
- V drvivej väčšine okolností chceme na Path vykonávať rovnaké operácie bez ohľadu na súborový systém
- Poskytnutím Path ako rozhrania pomocou továrenského vzoru sa vyhneme nutnosti písať zložitý alebo vlastný kód pre každý typ súborového systému

File Systems, Paths, Files

In NIO.2, both files and directories are represented by a path, which is the relative or absolute location of the file or directory.

Porovnanie java.io.File and NIO.2 metód

- V NIO.2 je k dispozícii množstvo metód a funkcií, ktoré nie sú dostupné v staršom rozhraní API, ako napríklad podpora pre symbolické odkazy, nastavenie atribútov špecifických pre súborový systém atď.
- NIO.2 je vyvinutejšie, oveľa výkonnejšie API ako staršia trieda java.io.File

Legacy I/O File method	NIO.2 method					
file.delete()	Files.delete(path)					
file.exists()	Files.exists(path)					
<pre>file.getAbsolutePath()</pre>	<pre>path.toAbsolutePath()</pre>					
<pre>file.getName()</pre>	<pre>path.getFileName()</pre>					
file.getParent()	<pre>path.getParent()</pre>					
file.isDirectory()	Files.isDirectory(path)					
file.isFile()	Files.isRegularFile(path)					
<pre>file.lastModified()</pre>	Files.getLastModifiedTime(path)					
file.length()	Files.size(path)					
file.listFiles()	Files.list(path)					
file.mkdir()	Files.createDirectory(path)					
file.mkdirs()	Files.createDirectories(path)					
file.renameTo(otherFile)	Files.move(path,otherPath)

Factory Method

Also known as: Virtual Constructor

□ Intent

Factory Method is a creational design pattern that provides an interface for creating objects in a superclass, but allows subclasses to alter the type of objects that will be created.

This article is a part of our eBook Dive Into Design Patterns.

Abstract Factory

Builder

Prototype

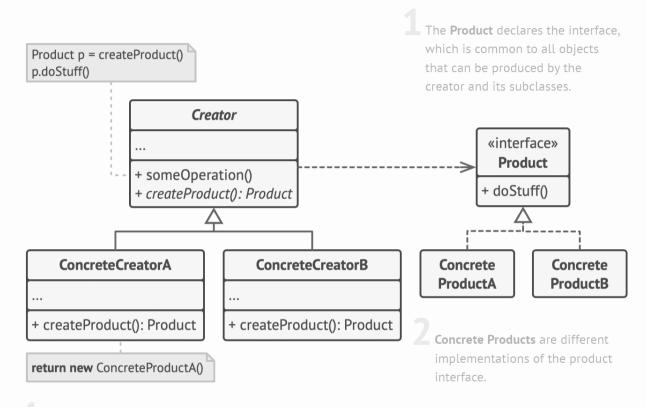

Singleton

品 Structure

The **Creator** class declares the factory method that returns new product objects. It's important that the return type of this method matches the product interface.

You can declare the factory method as abstract to force all subclasses to implement their own versions of the method. As an alternative, the base factory method can return some default product type.

Note, despite its name, product creation is **not** the primary responsibility of the creator. Usually, the creator class already has some core business logic related to products. The factory method helps to decouple this logic from the concrete product classes. Here is an analogy: a large software development company can have a training department for programmers. However, the primary function of the company as a whole is still writing code, not producing programmers.

Concrete Creators override the base factory method so it returns a different type of product.

Note that the factory method doesn't have to **create** new instances all the time. It can also return existing objects from a cache, an object pool, or another source.

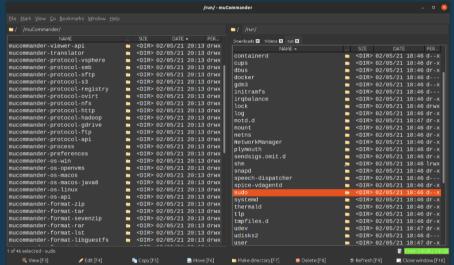

The easy to use file manager

muCommander is an open source, dual-pane file manager available on all major operating systems

Features

- Copy, move, rename and batch rename, email files
- Multiple tabs
- Universal bookmarks
- Credentials manager
- Configurable keyboard shortcuts
- Cloud storage Dropbox, Google Drive
- Virtual filesystem with support for local volumes, FTP,
 SFTP, SMB, NFS, HTTP, Amazon S3, Hadoop HDFS and Bonjour
- Archives ZIP, RAR, 7z, TAR, GZip, BZip2, ISO/NRG, AR/Deb, LST
- Checksum calculation
- Fully customizable user interface, configurable toolbars and themes
- Available in many languages

Java IO vs NIO

10

- Stream-oriented
- Blocking I/O

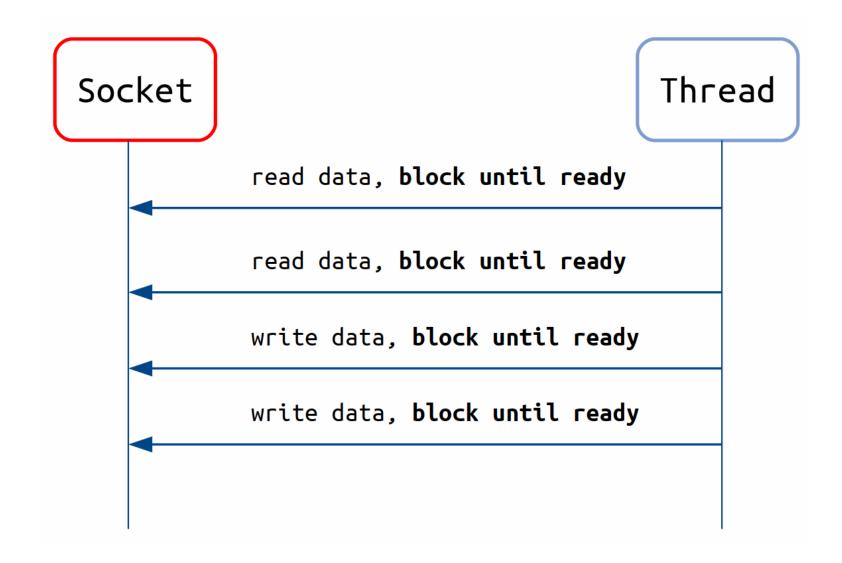

NIO/NIO.2

- Buffer-oriented
- Non-blocking I/O
- Selectors
- Channels

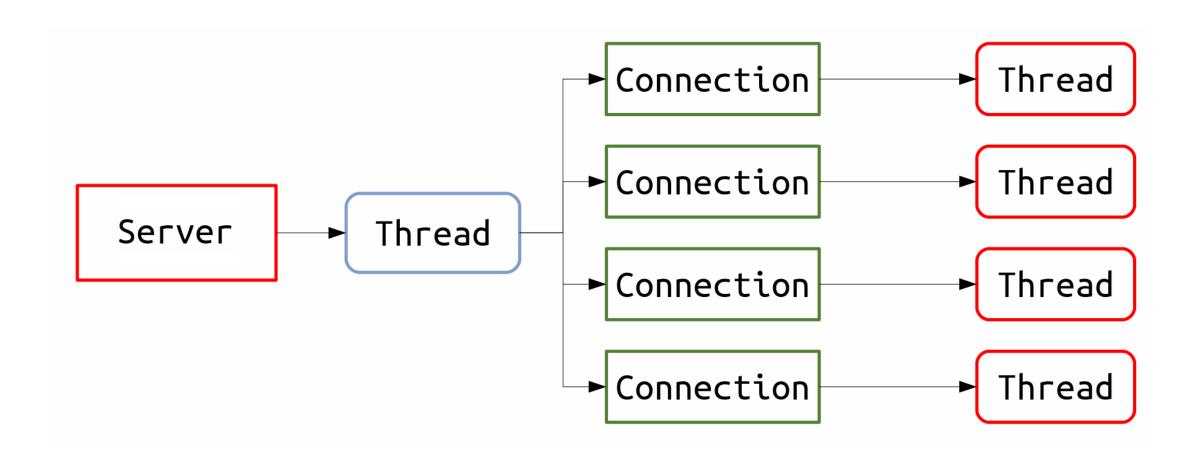

Java 10

Java.IO - Blocking I/O

Java.IO - Classic IO server design
